

Slide 1: The Vanishing Customers: Solved

- Main claim: churn is concentrated, not company-wide.
- Audience is VP of Growth, so keep it business-focused.
- Promise: we found who is leaving and the first fix to test.
- Transition: "Here is the whole case in three numbers."

Slide 2: Case Summary

- 13% of customers drive 72% of churn.
- This is good news: the fix can be targeted.
- Everyone else has only 3.1% churn.
- Proposed fix: solve billing problems on the second ticket.
- Transition: "Before the fix, here is how we tested the evidence."

Slide 3: The Investigation

- Data was clean: 8,500 customers, 12 fields, no missing values.
- Tested 9 possible churn drivers.
- Paired factors to find high-risk groups.
- Simple model double-checked the ranking.
- "% left" means churn rate in that group.
- "% of all churn" means share of the 825 churned customers.
- Transition: "The first suspect stood out immediately."

Slide 4: Suspect #1: A Second Billing Ticket

- Repeated billing friction is the strongest alarm bell.
- 682 customers.
- 56.5% churn.
- 385 churned customers.
- 47% of all churn.
- Interpretation: the first billing issue may be tolerable; the second means frustration was not resolved.
- Strongest candidate because it is high-risk and controllable.
- Transition: "The second risky group looks different, but it also points to a fixable journey problem."

Slide 5: Suspect #2: Promo Ghosts

- Partner-promo low-usage customers sign up but do not stick.
- 435 customers.
- 51.7% churn.
- 225 churned customers.
- 27% of all churn.

- Many are Premium, so this is not just free-user noise.
- Likely issue: promo users join before building a listening habit.
- Keep this as second priority, not the main fix.
- Transition: “What makes this powerful is that everyone else looks much healthier.”

Slide 6: The Innocent

- Core product/customer base is not broken.
- 7,418 customers outside the two risky groups.
- Only 3.1% churn.
- 87% of the base is outside the two risky groups.
- Broad discounts or broad product changes would waste money on mostly healthy customers.
- Transition: “So which clues actually held up across the analysis?”

Slide 7: Three Clues Held Up

- Confirmed predictors:
 - billing tickets
 - partner-promo signup
 - low-usage listening
- Model supports the same ranking.
- Especially strong: support tickets and ticket topic.
- Be careful: this identifies risk, not guaranteed cause.
- The 30-day test proves whether the fix works.
- If asked why not just use the model: segments are easier for the VP and operations team to act on.
- Transition: “We also checked the obvious explanations that did not hold up.”

Slide 8: False Leads

- Leadership was partly right, but not all complaints are equal.
- Playback is not the main problem: 4.9% churn, below average.
- Non-billing tickets are not the main problem: 2+ non-billing tickets only 6.1% churn.
- Premium alone is misleading: risk is concentrated in the two problem groups.
- Payment, age, tenure, and raw hours are not strong standalone drivers.
- Transition: “That leaves us with a specific, testable fix.”

Slide 9: The Fix

- Main recommendation: intervene at the second billing ticket.
- Action:
 - route to billing specialist
 - solve on that contact
 - give one-month credit only when billing friction is confirmed
- 297 customers in the risky billing group have not left yet.

- Billing-ticket group is 47% of churn.
- Estimated credit cost: about \$2.4K/month.
- If churn halves, around 190 more customers retained.
- Why this beats broad discounting: targeted, observable trigger, controlled cost.
- Transition: “We would not roll this out blindly. We would test it.”

Slide 10: 30-Day Measurement Plan

- This is an experiment, not a guess.
- Random split:
 - half get the billing-save intervention
 - half keep today’s process
- Track:
 - cancellation rate
 - third-ticket rate
 - first-contact resolution
- Success target: at least 10 percentage-point lower churn in the fix group.
- If it works, roll out.
- Then tackle Promo Ghosts as case two.
- Transition: “There is also a second improvement path once the billing issue is controlled.”

Slide 11: Other Improvements

- Partner-promo acquisition needs better quality control and onboarding.
- Acquisition cost is up 18%, so bad-fit promo users are expensive.
- Recommended improvement:
 - shift promotions toward users likely to become active listeners
 - encourage mixed content discovery early
 - monitor partner-promo churn separately
- Keep this secondary. Do not let it distract from the billing-ticket intervention.
- Typo note: “Aquisition” should be “Acquisition” if there is time to fix it.
- Transition: “We are ready for questions.”

Slide 12: Q&A

- Be ready to defend:
 - why billing is first priority
 - why playback is not the main fix
 - why the recommendation is targeted instead of broad
 - why the model supports the segment analysis
 - what you would test next
- If asked about causality:
 - “The data identifies a high-risk moment. The 30-day randomized test is how we prove the intervention works.”

- If asked about limitations:
 - “We do not have time-series behavior or exact ticket text, so we focused on observable fields and a measurable test.”
- Good closing line:
 - “The product is not broadly failing. The churn spike is concentrated, visible, and testable.”
